Abstracts

Food allergy is an immune system reaction that occurs soon after eating a certain food. Even a tiny amount of the allergy-causing food can trigger signs and symptoms such as digestive problems, hives or swollen airways. The number of patients suffering from food allergies is increasing, and hence, it is necessary to reduce the time and cost associated with the diagnosis. The demand for advanced diagnostic methods is rising with the growing number of food allergy patients. Moreover, food scanners, portable devices, apps, and wearables can help patients determine the ingredients in their food, which might prevent them from ingesting any ingredient they are allergic to. Market players are engaged in conducting research and development activities to improve product efficacy.
