Abstracts

Foot and ankle allograft is a treatment that involves transplanting a cell or tissue from one person to another in order to save lives, reconstruct limbs, and relieve pain in patients. The donor should be non-identical, belonging to the same species as the recipient but with a different genotype. It's usually utilized to improve the patient's quality of life during the reconstructive process around the foot and ankle. Allografts are transplanted from one person to another and are commonly utilized in foot and ankle reconstructive operations. Osteochondral grafts, osseous/structural grafts, and allograft tendons are the three broad kinds of allografts.
