Abstracts

Frame Transfer CCDs are inherently progressive scan. They capture a full frame in a single shutter (integration) period. They differ from Interline Transfer CCDs because they do not have a pixel storage area next to the active pixel and instead have a duplicate sensor used for storage below the active sensor. So for example a 640x480 pixel Frame Transfer sensor has a 640x480 active pixel array above another 640x480 storage pixel array. The storage pixels are masked (covered) so that no photons can hit them.
