Abstracts

Frozen shoulder is the general name for mucosal bursitis, which is a shoulder disease that limits the range of motion. In the case of frozen shoulder, the tissue in the shoulder joint will become denser, and the scar tissue will develop over time. Common symptoms include swelling, pain, and stiffness. Decreased shoulder movement will increase its stiffness. Prolonged inactivity due to injury, disease or surgery also increases sensitivity to inflammation and adhesions, which are hard tissue bands.

Treatment methods for frozen shoulder include medication, joint exercises, physical therapy, and surgery.
