Abstracts

The step-up transformer has a relatively strong boosting capability and a good boosting effect. The difference is that the non-excited voltage regulator switch does not have the ability to load shift gears, because the tap changer has a short-time disconnection process during the shifting of the gear position. Disconnecting the load current will cause arcing between the contacts. Bad tap changer or short circuit, so the transformer must be powered off when shifting. Therefore, it is generally used for transformers that do not require strict voltage requirements and do not require frequent shifting.
