Abstracts

Agricultural biotechnology is basically the evolution of farming and cropping through the advanced technology of genome sciences, plant grafting, genetic engineering and molecular breeding of plants. The term genotype refers to a cultivar (i.e. with material genetically homogeneous, such as pure lines or clones, or heterogeneous) rather than to an individual's genetic make-up. With regard to the comparison of plant material in a set of multi-environment trials, the term yield refers to the final product after each trial.
