Abstracts

After the thermosetting resin is processed and molded, an insoluble three-dimensional network structure is formed in the polymer molecule, which gives it better strength, heat resistance and chemical corrosion resistance. At the same time, it also makes the material brittle and cannot be recycled. Thermoplastic resin can melt at a certain temperature and then be plasticized and crystallized. It has good toughness and processability. It can be used for rapid processing and forming more complex products with low cost and certain recyclability.
