Abstracts

Global Navigation Satellite System (GNSS) is the general term for satellite tracking systems and covers GPS, Galileo, GLONASS, QZSS and Compass constellations. Systems for urban canyon applications need to incorporate a range of functions including GNSS tracking, inertial measurement, telemetry, and telematics processing. Given the volumes emerging telematics solutions are manufactured in, these functions often have to be spread across a number of discreet chipsets. With the advent of new low power, single-die, System-on-Chip GNSS solutions and MEMS inertial sensors, these functions can now be consolidated into one chipset, reducing the power-consumption, complexity, and cost of the overall system.
