Abstracts

HNTs are considered to be one of the most promising natural nanomaterials. Their unique combination of properties include a tubular structure, high aspect ratio, low cost and abundant availability, good biocompatibility and high mechanical strength. Their potential to serve as nanoscale containers for encapsulation of antimicrobial molecules, which has so far only been investigated on the laboratory scale. The value of HNTs is determined by the aspect ratio (the ratio of the length of the HNT to the diameter) and a lack of impurities. HNTs with a high aspect ratio and low levels of deleterious minerals are more highly sought after and are more valuable as they can be used in a wider range of applications.
