## Abstracts

Hardware acceleration is a process in which a task-specific hardware is installed in the computer to perform functions faster than the standard computing architecture of a normal central processing unit (CPU). In hardware acceleration, graphics or video processing chips are used to perform heavy computing tasks and operations. Sound cards enable higher-quality playback and recording of sound. Also, graphics cards can be utilized by hardware acceleration to allow quicker, higher-quality playback of movies, videos, and games. Graphic cards can also be used for better physics calculations and fast mathematical calculations. For instance, in Chrome, GPU hardware acceleration typically allows seamless browsing and media streaming.
