Abstracts

Heart block also termed as atrioventricular (AV) block refers to a condition, in which the electric signals that regulate the heartbeat are moderately or absolutely blocked from reaching the ventricles. On the basis of criticality, heart blocks can be classified into three degrees. First degree heart block involves partially slowed electric signals while passing from atria to ventricle. This stage does not cause much significant symptoms hence do not require treatment. Second degree heart block involves significantly slowed electric signals from atria to ventricle. This affects the proper working of heart. This type of condition is more common in people suffering from certain heart diseases; for instance heart failure. Third degree heart blocks result in complete blockage of signals from passing from atria to ventricle. Condition in which heart block is present in a person right from the birth, due to some defect or genetic condition, is termed as congenital heart block. Heart block may also be caused by some other conditions such as heart attack, some infections such as diphtheria, medicinal reactions and others. Various devices that can be used to treat heart blocks include pacemaker, which uses electric signals to regulate heart beat at a standard rate.
