Abstracts

Cardiopulmonary bypass (CPB) is a form of extracorporeal circulation in which the patient's blood is diverted from the heart and lungs and rerouted outside of the body. The normal physiologic functions of the heart and lungs, including circulation of blood, oxygenation, and ventilation, are temporarily taken over by the CPB machine. In most cases, the heart is also separated from the circulation (eg, aortic cross-clamping) and cardioplegia solution is administered to allow the cardiac surgeon to operate on a nonbeating heart in a field largely devoid of blood, while other end organs remain adequately oxygenated and perfused.
