## Abstracts

Hemostasis is a process of slowing and stopping the blood flow to initiate wound healing after a vascular injury. Hemostasis is the first step of healing a wound, it happens in three main stages, blood coagulation, platelet plug formation and lastly vasoconstriction. There are three types of devices which help speed up the hemostasis process, vascular closure devices (VCD), compression devices, and there are bandages coated with agents which will speed the clotting process. With the help of hemostasis diagnostic devices, we can predict the cause of bleeding during surgery by identifying any hemostatic defects which patients may have.
