Abstracts

Hexachlorodisilane is an organic compound and colourless and flammable gas with repulsive odor and forms the white fumes at leakage. Hexachlorodisilane has very high storage stability and reactivity so that it can be utilized as silicon pre-cursor for the low-temperature deposition. Hexachlorodisilane are primarily available in 3 purity grades in the market such as low, high and ultra-high. Low purity hexachlorodisilane consists of high metallic contamination and tends to decrease the reliability and efficiency. On the other hand, high and ultra-high purity hexachlorodisilane are refined to point the metallic impurities. Ultra-high purity hexachlorodisilane are mainly utilized in the thin film for microchip and solar applications, as well as for the base glass of fiber optics
