## Abstracts

High-frequency and high-speed PCB usually refer to printed circuit boards with frequencies above 1GHz. The production process of high-frequency and high-speed PCB is basically the same as that of ordinary PCB. The key point to achieve high-frequency and high-speed lies in the properties of raw materials, that is, the characteristic parameters of raw materials. The main material of high-frequency and high-speed PCB board is high-frequency and high-speed copper clad laminate, and its core requirements are to have low dielectric constant (Dk) and low dielectric loss factor (Df). In addition to ensuring lower Dk and Df, the consistency of Dk parameters is also one of the important factors to measure the quality of the PCB board. In addition, another important parameter is the impedance characteristics of the PCB board and some other physical characteristics.
