Abstracts

The high-performance messaging infrastructure provides a single and secure support for mutual messaging that simplifies the integration of applications and services across a variety of platforms, avoids information loss, and ensures that system functions do not break even if connections change. In the cloud framework, the application is broken down into tiny individual elements to simplify design and coding. The high-performance messaging infrastructure enables the split cloud-based applications to interact with each other or with local systems. High performance message infrastructure improves architectural dependencies before messages are stored on disk until they are received for service confirmation processing. This infrastructure allows applications and systems that exist in different clouds (public or private) to interact regardless of location. Using a high-performance messaging infrastructure can enhance failover and protect information from being forged or corrupted between topographically and technically different systems. Decoupling of services enables a single component to function regardless of the failure of adjacent services or applications - asynchronous communication networks. In addition, the high-performance messaging infrastructure can be used in scenarios that require high levels of security, fault tolerance, and accuracy, including airline reservations or updated medical patient records. It solves the problem of exchanging a large number of messages per second, or the delay of messages to a huge cost.
