Abstracts

When the high-pressure centrifugal fan is working, the power machine (mainly the motor) drives the impeller to rotate in the volute casing, and the air is sucked in from the center of the impeller through the suction port. Due to the dynamic action of the blade on the gas, the gas pressure and speed are increased, and under the action of centrifugal force, the gas is thrown to the casing along the blade path and discharged from the exhaust port. Because the flow of gas in the impeller is mainly in the radial plane, it is also called radial flow fan.
