Diatomaceous Earth, also known as D.E., is a type of powder made from the sediment of fossilized algae found in bodies of water. The raw diatomite is a naturally occurring, soft, siliceous sedimentary rock that is easily crumbled into a fine white to off-white powder. It has a particle size ranging from less than 3 micrometres to more than 1 millimetre, but typically 10 to 200 micrometres. The properties which make Diatomaceous Earth valuable include low density, high porosity, high surface area, abrasiveness, insulating properties, inertness, absorptive capacity, brightness, and high silica content. It is mainly used as filter aids, fillers, absorbents etc.
