Abstracts

Electroplating refers to the electroplating of metal ions in electroplating solution to the surface of wafer to form metal interconnection in the process of chip manufacturing. At present, semiconductor electroplating is widely used, including the deposition of copper wire, nickel, gold, tin silver alloy and other metals, but mainly the deposition of metal copper. Copper wires can reduce the interconnection impedance, reduce the power consumption and cost of devices, and improve the speed, integration and device density of chips.
