Abstracts

Tg is one of the most important properties of any epoxy and is the temperature region where the base material (polymer or glass) changes from a solid, rigid and glassy state to rubbery state. Every PCB has a different Tg value based on its substrate. And PCB will start to change its state which will make a bad effect in PCB fabrication if the operating temperature of PCB exceeds its Tg value. High Tg PCB boards have a better stability at high temperatures because the substrate provides better heat resistance, mechanical and chemical stability for the board.
