Heterojunction (HJT) is a special PN junction, which is formed by amorphous silicon and crystalline silicon materials. It is a kind of N-type battery by depositing an amorphous silicon film on crystalline silicon. The basic principle of Heterojunction Technology Cell is in N-type silicon. A heterojunction is formed on the wafer substrate by deposition of amorphous silicon and serves as a passivation layer. The open circuit voltage of the battery with this structure Higher, the efficiency will be higher accordingly, and the outermost layer has a TCO transparent conductive layer. The process uses low temperature process, the temperature of the silver paste is usually around 200 degrees, which is convenient to use thinner N-type silicon wafers, so that there will be larger silicon wafers in the future. There is room for cost reduction.
