Hydraulic machine is a power machine that converts the energy of water flow into rotary mechanical energy. It belongs to the turbine machinery of fluid machinery. As early as around 100 BC, the prototype of the hydraulic machine, the water wheel, appeared in China, used for irrigation and driving grain processing equipment. Modern hydraulic machines are mostly installed in hydropower stations and are used to drive generators to generate electricity. In a hydropower station, the water in the upstream reservoir is channeled through the diversion pipe to the hydraulic turbine, which in turn turns the turbine wheel and drives the generator to generate electricity. The finished water is discharged downstream through the tailrace. The higher the head, the greater the flow, the greater the output power of the hydraulic machine.
