Abstracts

Because of its good biocompatibility, biocompatibility and low friction, hydrogels have high application value in the coating of medical devices. Hydrogel coatings have affinity for water. From a chemical point of view, this means that the coating will participate in the dynamic hydrogen bonding process with water in the medical device environment. In most cases, the hydrophilic coating is also ionic and usually has a negative charge, which will be more conducive to the interaction with the aqueous solution.

From a physical point of view, the chemical interaction between coating and water will form a gel material, which will exhibit very low friction coefficient. In general, these chemical and physical characteristics describe a wettable, lubricated material suitable for specific biological interactions. At present, it is mainly used in medical device intervention products.
