Fossil fuel based power generation is the most popular form of power generation in the world. However, depleting reserves of fossil fuels has prompted the industry to shift to renewable sources. The growing energy demand on account of growing global population coupled with the need to reduce reliance on conventional power generation has been prompting the industry to use renewable power sources. One of the most popular renewable power generation technologies includes hydropower which does not cause any greenhouse gas emissions and toxic waste. After building a dam and installation of equipment the source of energy i.e. flowing water is free therefore making hydropower is one of the cheapest ways to generate electricity. It is one of the cleanest fuel sources which get renewed regularly by rainfall and snow. Hydropower is readily available because according to the demand and requirement the flow of water can be controlled through turbines by engineers and the reservoirs may also offer recreational opportunities and activities such as boating and swimming.
