Abstracts

The term hygienic and aseptic valves means to be free from contamination caused by harmful bacteria, microorganisms, or viruses. When applied to valves, it means the materials and surface finish of the valve are optimized for exceptional cleanability. It also means each component of the valve that comes in contact with the process is hermetically sealed from the environment and atmosphere that surrounds the process. This is achieved by using a bellows on the valve stem to prevent harmful bacteria, et al, from getting into the process. Hygienic and Aseptic Valves are common in food, beverage, and dairy manufacturing. They are found in processes where cleanability (CIP or COP) is extremely important.
