Abstracts

Hysteroscopy is a simple procedure performed by doctors and gynecologists to investigate or look into the uterus of a woman with the help of a device called hysteroscope. Hysteroscopy is usually done to investigate and diagnose abnormal vaginal bleeding, such as heavy periods, bleeding after menopause, and heavy bleeding between periods. This procedure is also used if certain abnormalities of the uterus are detected during an ultrasound scan. These abnormalities include thickening of endometrium, polyps, and fibroids. This medical procedure enables doctors to see inside of the uterus (the endometrial cavity) and to plan an appropriate treatment under direct vision. A basic hysteroscope consists of a narrow long telescope with a light source and a camera attached to its distal end. The light source helps in illuminating the area which is to be visualized. The camera attached to the proximal end of the hysteroscope enables to project the image on a large video screen.
