Abstracts

Access control is a security technique that can be used to regulate who or what can view or use a resources environment, whereas Identity is a set of attributes related to an entity that computer systems use to represent a person, organization, application, or a device. In fact, there is a direct relationship between access control and identity management because the core function of an identity management solution is access control.

The same identity can be associated with multiple accounts (representations of a user within the system) and identifiers (how a user is labeled). For example, you may have multiple email accounts that belong to one identity (person, organization or device). Authentication is the process used to determine whether the user is who they claim to be. Once the user is authenticated, authorization determines whether the user is allowed to access a particular resource or take a specific action.
