Abstracts

An implantable loop monitor is a device that can be implanted just underneath the skin, left of the breastbone. This device can serve as a literal continuous ECG-recording machine, recording a patient's heart rhythm for up to 3 years. The biggest advantage of this system is for patients who have symptoms that are not that frequent—that is, patients who may present with syncope once every several months or even yearly, in which case short-term external monitors have limited utility. In addition, the issue of patient compliance in tolerating bulky external monitors is eliminated. These small devices are contained in a metal alloy casing with an internal battery and microchips for recording and storage of the tracings of your heart rhythm.
