## Abstracts

The industrial furnace is equipment that dries and bakes various objects such as water, solvents, and powders using a variety of heat sources.

This report focus on Industrial Furnaces for Surface Coating, or the industrial curing furnace market.

An industrial curing furnace is a piece of thermal processing equipment designed to improve the strength and durability of a material by accelerating a desirable chemical reaction. In its simplest format, a curing oven achieves this by elevating the temperature of a sample material to within or above a specific limit. This may be enough to improve the physiochemical linkages within the material and improve the mechanical characteristics of the product. More often, one or more catalyzing agents are introduced into the curing oven to facilitate the required reaction.

Curing ovens are commonly used to engineer raw materials such as synthetic adhesives, thermoset polymers, and rubber. Chemical curing is also used to enhance the properties of construction materials in situ, but this application requires highly-specialized curing apparatuses to encourage thermosetting in situ over extended periods.
