Abstracts

Influenza medication includes antiviral drugs prescribed for the treatment of influenza. Influenza, also known as flu, is a respiratory disease caused by an influenza virus. It is a viral infectious disease that includes three major types: type A, type B, and type C. The common symptoms of the disorder are cold, cough, fever, and sore throat, which can be severe or mild. Seasonal outbreak of influenza primarily occurs in winter. Most people generally recover fully, but severe complications such as pneumonia can also develop. Initiation of antiviral treatment is recommended for hospitalized influenza patients. High growth of the global influenza medication market is due to unmet medical needs within the annual influenza epidemics along with strong R&D focus resulting in new and advanced treatments and drugs, and increasing demand due to government stockpiling.
