## Abstracts

The infrared heaters are efficient heating systems that support crop production by maintaining the temperature of the soil. These devices convert electricity or gas into radiant heat. They make use of infrared technology for supplying heat. The infrared heaters do not cause any risk to the environment and do not emit any harmful gases. These can be used as an alternative in winter when any other energy source is not available. These heaters are used in crops as they provide the optimum required temperature for cultivation. It is mainly used in livestock farming as it transfers heat directly from the heater to the body of plants to maintain the desired temperature.
