## Abstracts

Inhalational anaesthesia drugs, ether and halothane were more commonly used in the past, and sevoflurane, desflurane, and isoflurane are more commonly used. Inhaled anesthetics can enter the lungs through the patient's respiratory tract, diffuse into the capillaries, and then enter the body's circulatory system and central nervous system. For inhalational anaesthesia drugs, professional equipment should be used. The patient can make the pain and consciousness disappear within a few minutes after the inhalation anesthesia, so that the operation can proceed smoothly. After stopping the medication, the patient can quickly regain self-awareness. Inhaled anesthetics are characterized by strong controllability and high safety, and they are a common method of anesthesia used in clinical practice.
