Injection Molded Plastic Gears have positioned themselves as serious alternatives to traditional metal gears in a wide variety of applications. The use of plastic gears has expanded from low power, precision motion transmission into more demanding power transmission applications. As designers push the limits of acceptable plastic gear applications, more is learned about the behavior of plastics in gearing and how to take advantage of their unique characteristics.

Injection Molded Plastic Gears provide a number of advantages over metal gears. They have less weight, lower inertia, and run much quieter than their metal counterparts. Plastic gears often require no lubrication or can be compounded with internal lubricants such as PTFE or silicone. Plastic gears usually have a lower unit cost than metal gears, and can be designed to incorporate other features needed in the assembly (part consolidation). These gears are also resistant to many corrosive environments.

The first use of thermoplastic gears undoubtedly consisted of neat nylon and acetal gears carrying low loads at low speeds. As the advantages of using thermoplastic gears became clearer and new, higher performance materials became available, designers began using plastic gears in more demanding applications. The use of reinforcements and internal lubricants compounded into these materials has expanded their use even more.
