Abstracts

Intracranial aneurysm, also known as brain or cerebral aneurysm, is a bulging, weakened area in the wall of an artery in the brain. It results in an abnormal ballooning, widening, or bleb. An intracranial aneurysm majorly occurs in an artery located in the front part of the brain, which supplies oxygen-rich blood to the tissues. Factors contributing to the formation of intracranial aneurysm are hypertension, smoking, injury or trauma to the blood vessels, complication from few types of blood infections, and genetic predisposition. The treatment of intracranial aneurysm includes medical therapy, surgical clipping or therapy and endovascular therapy or coiling without or with adjunctive devices.
