## Abstracts

In the traditional network security threat model, it is assumed that all personnel and equipment in the intranet are secure and credible, while the external network is insecure. Based on this assumption, the security solutions of external network, such as anti-virus software, firewall, IDS and so on, are produced. Due to the lack of effective technical means, the relevant network authorities can not form a sound management mechanism, which makes the enterprise's intranet management in a long-term passive management situation, and the ability to deal with information network security incidents quickly is weak.
