Abstracts

An intrathecal pump is a medical device used to deliver medications directly into the space between the spinal cord and the protective sheath surrounding the spinal cord. Medications such as baclofen, morphine, or ziconotide may be delivered in this manner to minimize the side effects often associated with the higher doses used in oral or intravenous delivery of these drugs.

Intrathecal pump is a surgically implanted system used to infuse potent medication directly into or around the spinal cord. These pumps are typically intended for use in chronic pain and spasticity management for delivering potent medicines in the intrathecal space which allows administration of drugs in very low doses.
