Abstracts

Electrolyte analyzers measure electrolyte levels in the human body to detect metabolic imbalances and measure renal and cardiac function. The electrolytes measured include sodium (Na⁺), potassium (K⁺), chloride (Cl⁻) and bicarbonate (HCO₃⁻ or CO₂). Electrolyte analyzers are used in hospital and reference laboratories, and also point of care settings. Most electrolyte analyzers use blood plasma, serum, or urine samples; some analyzers can use whole blood (for faster turnaround time) and cerebrospinal fluid (CSF). Electrolytes are measured using ion selective electrodes (ISE) and colorimetric and photometric techniques. Most electrolyte analyzers are capable of high throughput ranging from 400 to 2400 tests per hour.

ISE Electrolyte Analyzer refers to the analyzer that uses advanced ISE (Ion Selective Electrode) technology.
