Abstracts

A jack-up rig is a mobile platform used as exploratory drilling platform and offshore platform that consists of a buoyant hull with moveable legs, capable of lifting the hull over the sea surface. The buoyant hull is a water-tight barge that floats on the water surface and used to transport all the machinery to a desired location. Once a rig arrives at work location, the legs are jacked down onto the sea floor where the weight of barge and ballast water drives the legs into the bottom of sea to avoid further penetration during operations.
