Abstracts

Cartilage is a soft and rubbery material present in the bone joint and is involved in preventing friction between the bones by acting as a shock absorber in the joint. Damage to cartilage restricts the normal movement of knee causing pain and most often occurs after a traumatic and twisting injury to the knee. If left untreated, it may require knee replacement surgery. Knee cartilage repair has been beneficial for conditions such as mal-unions, delayed unions, and slow healing wounds. Advances in knee cartilage repair products have bolstered the growth of this industry.
