Abstracts

Lactobacillus acidophilus is one of the species of the genus Lactobacillus, which is a bacteria that exists naturally in the body, primarily in the intestines and the vagina. Morphologically, Lb. acidophilus bacteria are Gram-positive, non-spore-forming rods with rounded ends that occur singly, in pairs, and in short chains. The Lb. acidophilus group is fastidious organisms adapted to growth on complex organic substrates and contains mainly obligately homofermentative lactobacilli, but a few are facultative heterofermenters. The bacteriocins produced by the Lb. acidophilus group include lactocin B, lactacin F, acidocin A, and acidocin B. Lactobacillus acidophilus also has been used as a probiotic, or 'friendly bacteria.' The health benefits associated with these strains include reduction of gastrointestinal symptoms in lactose-intolerant individuals, relief from symptoms of constipation, treatment of infantile diarrhea, prevention of travelers' diarrhea, and activity against Helicobacter pylori.
