Abstracts

Distention systems are devices which are equipped and assembled with pumps. These devices manage the fluid systems to improve visualizations during a procedure. Distention systems are cost efficient. These distention systems are used during laparoscopic as well as endoscopic orthopedic procedures. The device maintains the cavity of the joint filled with a pressurized distention solution such as saline, which expands the joint. The device releases a controlled amount of solution to maintain the pressure and cavity of the joint. The system helps remove debris and blood from the operative site by pumping the fluid at a regular rate with a constant pressure, thereby increasing maximum efficiency by obtaining a clear environment in the joint during the procedure in the operating room.
