Abstracts

Laser Beam Melting is a powder bed based additive manufacturing process that is most widely used in the industry. Laser beam melting is an additive manufacturing process in which 3D components are digitally 'cut' into 2D layers. In a powder bed, the cohesion of the particles is achieved via a high-performance laser that exposes the contours and surfaces of the 2D layers, causing the powder to melt and bond locally at these points. The steps are repeated layer by layer as the building platform lowers after each exposure to make room for a new layer of powder. After the last layer has been exposed, the components, including the platform on which they were built, are de-powdered and removed from the system. The components can now be separated from the platform. Heat treatment is suitable as post-processing in order to eliminate thermal stresses.
