The digital revolution is bringing disruptive changes into manufacturing industry contributing to the emergence and development of new innovative techniques. Additive manufacturing (AM) is a state-of-the-art technology to produce complex, freeform, and previously un-manufacturable geometries by incrementally layer-by-layer fabrication processes. The AM technology, fueled by the advent of new materials, methodologies, and optimization techniques, is promised to make manufacturing smarter, more efficient, and sustainable.

Laser cladding, as a well-established AM technique with excellent capacity for smart optimization due to its integrated closed loop control, has the potential to accelerate this manufacturing revolution and is now considered as an attractive candidate for applications such as hybrid manufacturing/remanufacturing as well as 3D printing of functionally graded materials. Laser cladding has evolved into a potent three-dimensional (3D) additive manufacturing technology by stacking the deposited material layers.
