Abstracts

Laser cladding is a process in which a metal coating is applied onto the surface of a part using a laser as the heat source. The process is often used to create a protective coating for increased functionality, as well as restore damaged or worn surfaces. Laser cladding allows extended life of equipment and machinery in which parts are exposed to corrosion, wear or impact. For example, the construction equipment industry applies this technology to their products to increase wear resistance and keep equipment in service longer.
