Abstracts

Laser doping intelligent manufacturing equipment, through laser doping technology, heavily doped the contact part between the metal grid line (electrode) and the silicon wafer, while maintaining light doping (low concentration doping) outside the electrode. This structure reduces the recombination of minority carriers on the emitter surface, and a good ohmic contact can be formed between the metal electrode and the emitter, so as to obtain higher short-circuit current, open circuit voltage and filling factor, Improve the conversion efficiency of solar cells. Adding laser doped intelligent manufacturing equipment to the conventional production line can realize the upgrading and transformation of selective emitter solar cells in perc production line, easily increase the conversion efficiency by 0.2 ~ 0.3%, and easily increase the power of standard modules by 3 ~ 5W.
