## Abstracts

LENS is an advanced additive manufacturing technology based on the idea of discrete stacking and forming. LENS 3D manufacturing systems use lasers to build objects layer by layer directly from powdered metals, alloys, ceramics or composites. The LENS process must take place in a hermetically-sealed chamber which is filled with argon so that the oxygen and moisture levels stay very low. This keeps the part clean and prevents oxidation. The metal powder material is directly delivered to the material deposition head. Once a single layer has been deposited, the material deposition head moves on to the next layer. By building up successive layers, the whole part is constructed. When complete, the component is removed and can be heat-treated, hot isostatic pressed, machined, or finished in any required fashion, specially suitable for complex structures such as curved cavities, suspended thin walls and variable cross-sections.
