Abstracts

The laser warning system is an instrument that automatically determines abnormal phenomena and states based on the data obtained by the laser sensor observation and pre-determination algorithms. It can identify the existence of the target and its parameters (radiation intensity, wavelength, bandwidth, position, etc.), and finally can alarm in the form of sound, light or data, or directly control the interference of the interference system. Some of these alarm systems can simply detect individual events, and some can detect, identify, and locate multiple threats in a variety of weapons. Others including Coherent Recognition LWS and Holographic LWS?
