Abstracts

Lead is a soft, dense, and low-melting metal used as a significant component of the automotive battery. As it is water resistant, lead is also used in paints to develop long-lasting roofing material and in the plumbing industry. It is extensively used in number of commercial applications such as health technology, insulation & cabling, weights, and soldering. Lead is produced from mined lead ore or from secondary production, where it is recovered from recycled products.

It is extracted from underground mines and usually found in traces of different metals such as galena, silver, copper, zinc, cadmium, antimony, and arsenic. It has high economical value and is relatively economical to produce.

Increase in demand in automotive industry to manufacture batteries drives the global lead mining market. Focus of lead producers to develop new applications for lead presents a substantial growth opportunity to the industry players. However, high toxicity leading to pollution of water supplies may restrain the growth.
