Abstracts

LED driver ICs are current-controlled regulators that provide biasing current required to activate single LEDs, an LED strip, or multiple LED strips. LEDs emit light when required biasing currents activate forward voltage of the part. Drivers typically drive multiple LEDs situated in either series, parallel, or series-parallel configurations. The color of the light emitted by LEDs is determined by the material used to make the part. Common colors are red, amber, yellow, green, blue, and white.

Driver ICs are used in a variety of LED lighting applications. The drivers may provide current for one LED or for a string of LEDs. The LED driver ICs provide nominal current biasing within the IC, with the option for providing an external resistor to change the bias point. Changing the bias point either increases or decreases constant current through the LEDs. Dynamic brightness control may be added with PWM circuits. Simple drivers require external PWM circuits while more sophisticated driver designs incorporate internal registers able to apply PWMs for brightness control.
