Abstracts

The induction suspension melting furnace adopts the principle of electromagnetic induction and water-cooled copper crucible to melt the melted material, and the melting charge is in a suspended state under the action of electric power. The advantage is that the contamination of the crucible to the material is minimized. The water-cooled copper crucible is made of high-purity oxygen-free copper, especially for some materials that react strongly with the crucible (such as titanium and its alloys). . It has been widely used in the casting of titanium, zirconium and its alloys.
